

Filename: html_formatter.py

Bug type: incorrect output

Bug report

Expected Behaviour

We created a widget that allows quick formatting of .html files in a more readable format.

When the widget starts, it should prompt the user for a file to format as well as an output file.

The app formats the tag and their content into nested indented blocks. By example a text file containing the following:

```
<body><div><h1>My Page</h1><p>Welcome to my page!</p></div></body>
```

Should output:

```
<body>
  <div>
    <h1>
      My Page
    </h1>
    <p>
      Welcome to my page!
    </p>
  </div>
</body>
```

Bug

Since the last update of our app, our developers have been reporting that the tool does not properly indent their html. Here is an example of content they found to be improperly formatted.

```
<p>Welcome to my page!</p>
```

Which is formatted to:

```
<p>
  Welcome to my page!
</p>
```
