Bug report

Expected Behaviour

The Cégep de la Gaspésie et des Îles is working on a new platform for students and teachers called Omnivox 2. The content of the platform is secret and full of new features which cannot be revealed yet, so we only sent you the code relevant to this bug.

In the folder `/login` you will find the file `login_page.py`. Running this file starts the server-side of Omnivox 2. By default, you should be able to open your browser and access it at address http://localhost:8000.

The login page is all you need to get access to. When a user enters their username and password, they will generally be redirected to Omnivox 2.

For now, when the user connection is successful the page should display:

```
Welcome [username]! You are now connected.
```

Otherwise, by example if the password is incorrect, the following will be displayed:

```
Connection error...
```

Bug

Currently, even existing users are not able to connect to Omnivox 2.

On starting the server, the admin user is created. You should be able to connect with the following credentials:

```
username: admin
password: admin
```

Although, when entering this input, this is what is displayed instead:

```
Connection error...
```
