Filename: `rectangle.py`
Bug type: `program freezes`

Bug report

Expected Behaviour

As a practice in an introduction to programming course, as student was asked to write a Python program which prompts the user for a width and a height. The program should then print a rectangle using '*' characters of the given dimensions.

Here is an example of what the console should look like after the user input.

```
I will draw a rectangle for you.
Width of the rectangle: 5
Height of the rectangle: 5

*****
*****
*****
*****
*****

Done! Thank you!
```

Bug

The program freezes for most inputs. By example, when trying to print a 5 by 5 rectangle, nothing is printed to the console and the program never exits.
